

Invisible Illness And Identity Are Deeply Connected

The number of people with disabilities is [on the rise](#), yet not all [illnesses](#) are visible. The absence of reliable [medical testing](#) and a lack of [funding](#) for medical research has long meant that people with invisible illnesses are left out. This means that people in pain are left without support and often, without proper diagnoses. People with invisible illnesses also experience other difficulties when it comes to managing their illnesses. These include [stigma, lack of popular understanding](#), blame, [relationship issues](#), anxiety, depression, and loneliness. Despite these challenges, it is important to remember that we are talking about real people. So, how do invisible illness and identity connect?

A [strong sense of self](#) is of paramount importance to navigating society and the medical realm. There is an urgent need to address the [global economic implications](#) of invisible illnesses if we truly want to achieve the [Sustainability Development Goals \(SDGs\)](#).

demystifying Invisible Illness and Identity

Invisible Illness

Billions of individuals globally suffer from invisible illnesses: physical, mental or neurological conditions that have symptoms that are not visible externally, but that [limit human functionality](#), or challenge a person's movements, senses, or way of life in a negative capacity. People with invisible illnesses are still fully fledged humans that live full lives, despite the challenges, so it is important to raise awareness about the unique beauties and difficulties of their lives.

Invisible illnesses can be hard to diagnose with simple medical tests, and there are extensive challenges that come with diagnoses- results can be [vague and subjective](#). People who suffer from invisible illnesses bear the extra burden of people in their life who don't believe that they are ill because they [don't 'look sick'](#). Regardless of these burdens, people with invisible illnesses develop interesting perspectives on their own humanity and health, and have a valuable perspective that is worth sharing and listening to.

“The term ‘invisible illness’ refers to any medical condition that is not outwardly visible to others, even healthcare professionals. Invisible illnesses encompass a broad range of conditions, including heart disease, diabetes, dementia, psychiatric illness, autoimmune disorders, and even cancer.”

Illness And Identity

A person diagnosed with an invisible illness endures the significant [chronic physical distress](#) of the disease. As well as this, they also often have an [identity crisis](#) and feel [detached from themselves](#). It can be challenging to adapt to a [new normal](#).

An individual's sense of self {is} defined by (a) a set of physical, psychological, and interpersonal characteristics that is not wholly shared with any other person and (b) a range of affiliations (e.g., ethnicity) and social roles. Identity

involves a sense of continuity, or the feeling that one is the same person today that one was yesterday or last year (despite physical or other changes). Such a sense is derived from one's body sensations; one's body image; and the feeling that one's memories, goals, values, expectations, and beliefs belong to the self.

- [APA Dictionary of Psychology](#)

Transitioning Into a New Identity

Any chronic illness can have an [overpowering effect](#) on every domain of our life, and redefine our sense of self. We may have to [re-evaluate our goals](#), career options, activities that we can undertake, and even simple daily choices. This new normal may shut a few avenues, and you may feel a [deep sense of loss](#) of your identity. This [grieving phase is normal](#), and eventually the new reality will open new opportunities for you.

“Researchers have conceptualized four different illness identity states: rejection, engulfment, acceptance, and enrichment. Each of these states have ramifications for our mental and physical well-being.”

- [Psychology Today Blog](#)

Rejection

This refusal phase can encompass [dismissing](#) or ignoring the existence of the illness or [minimizing its effects](#). This often has the effect of [preventing us from seeking medical help](#) or adhering to a treatment regime. This can further [aggravate the disease](#), and profoundly impact our quality of life. When we see a progression of the illness, [additional health care costs](#) and indirect economic impacts will become inevitable.

Engulfment

This is the phase where the disease is [overwhelming](#). People in this state disregard other domains of their life such as [relationships and hobbies](#). Naturally, they feel elevated [anxiety and depression](#) in this period.

Acceptance

[Grieving](#) is an essential part of moving towards true acceptance of the illness as part of one's identity. The disease is [not ignored](#), but is also not overpowering. Anxiety and depression also [subside](#).

Enrichment

This stage revolves around [realising positive changes](#) as a result of the illness. People begin to appreciate the little joys in life, experience a [renewed perspective](#), gain clarity on their values, gain [resilience](#), and experience enhanced well-being. This stage may also include career changes that lead to new paths like [advocacy work](#), or new friendships made with deeper understanding of others and the self. Expressing yourself through [art or journaling](#) can also be part of enjoying one's new life.

While invisible illness shifts self identity through the above stages, cultural identity also has its implications, which is explored in the next section.

invisible illness And cultural identity

While adapting one's self identity to a disease is demanding, the matter of one's [cultural identity](#) can add even more to a sense of being blocked. Needing to understand one's illness within the context of one's cultural identity can exacerbate the burden of the disease for [marginalised groups](#) in society. Systemic biases often prevail in the health care systems of the world. As well as this, negative [societal attitudes](#) towards age, [gender](#), [race](#), [sexual orientation](#), and [immigration status](#) among other factors are more pronounced towards people with invisible illnesses. A person with an [invisible condition faces extra barriers](#) in accessing healthcare if they are from a [minority group](#).

Gender bias in medicine and science

The interplay between invisible illness and gender identity is [disturbing](#). Invisible illnesses affect females [disproportionately](#) more than males. This is especially true for [conditions](#) like chronic fatigue syndrome (CFS), Lyme's disease, [lupus](#), fibromyalgia, and [Crohn's disease](#). The Autoimmune Association has reported that a striking [80% of patients](#) with autoimmune diseases in the US are women.

A study published in September of 2021 in [The Journal of Pain](#) found that the presence of [gender bias](#) posed elevated challenges for women in this regard. The pain endured by women was [downplayed compared to men](#) by the observers in this study. As a result, the observers [recommended more psychotherapy](#) for females, while increasing doses of pain medications for males.

Similar results were noted in [this BIPOC long-COVID study](#), where women of colour around the world shared their experience with long COVID illness. About [63%](#) of them reported to have been not believed by their doctors. More shockingly, 19.6% of the 27 females who visited the hospital seeking medical attention [were drug tested for narcotics](#).

Systemic gender bias unfortunately prevails in medicine and science.

how invisible illnesses wreak havoc

Physical and economic impacts

Health professionals have a habit of [misdiagnosing, disregarding or dismissing](#) the symptoms of patients with hidden illnesses. This prevents those suffering them from [accessing necessary and adequate medical support](#) as any other patient with a visible ailment would. This results in the affected parties living with the [burden of the disease](#) for long periods without any medical intervention. In some instances this lasts a lifetime. Effects of a lack of medical attention obviously hinder productivity, creating [housebound](#) individuals who rely on others for their daily needs.

Mental and Social impacts

Clinicians often [react irrationally](#) when patients present, owing to a [lack of visible evidence](#) of their illnesses. Doctors may express [apathy, frustration](#), etc. They may also [accuse the patients](#) of being hard to handle, dishonest, or label their diagnosis as [psychosomatic](#). This can take a toll on a patient's [mental well-being](#). When people feel [misunderstood, lonely](#), and helpless, despite their thorough knowledge of their condition, crisis is inevitable. It would seem that [stigma](#) is caused by numerous factors - knowledge of the diagnosis, moral judgments, and incorrect knowledge held about the disease.

Those suffering from invisible conditions feel pressured to [prove their symptoms](#). They feel the need to show that their [symptoms are legitimate](#), against all misconceptions. Others may easily [downplay](#) the pain based on outer appearances, which can be [depressing and stressful](#). If one does not have a [strong sense of self](#), these situations damage one's self-esteem and self-worth.

Those suffering from these invisible conditions have to [prove their symptoms](#) to society against misconceptions.

strategies to increase awareness about invisible illness and identity

Self-belief and self awareness

- Invisible illness sufferers should [trust themselves](#), and [be their own advocates](#). They must [not ignore](#) their symptoms simply because a medical professional disregards them, as it can be life-threatening. Developing a [strong sense of self](#) and [self-efficacy](#) is key to believing in how they feel, and to confidently seek treatment to overcome it.
- Sufferers can keep [track of their symptoms](#), and specifics, such as the location of pain or fatigue, the time period, and the situation surrounding its occurrence. Additionally [collating all the lab results and imaging studies](#) can be quite useful when putting all the information together to identify the exact diagnosis. [Self awareness is important.](#)

Research and self education

- [Reading research materials](#) published by leading universities and bodies that are relevant to their condition is of great assistance to sufferers in [understanding their unique needs](#) better. It will also [equip people to educate and explain their experiences clearly](#) to others. This helps relieve their stress, and [strengthens their relationships](#) due to openness and honesty. It helps sufferers to reveal their authentic identity to the world, while embracing the illness.
- A [focused approach](#) can help medical professionals give close and thoughtful attention to symptoms. [Family history](#) often helps to identify an increased risk of potential disorders. Likewise, conditions the patient has already eliminated through their own research, and tests they may have [already done](#) also help the treating clinician. It is therefore imperative for sufferers to research and familiarise themselves with the [right medical terms](#).

- Patients may [consult other medical professionals](#) if [a doctor dismisses](#) their symptoms. This ties back to having complete [self awareness](#) and a [healthy sense of self](#).

Engagement with a support group

- Sufferers of invisible illness could [engage with others](#) within their neighbourhood [with similar conditions](#), and seek suggestions about [supportive medical practitioners](#). The [internet](#) can be a powerful tool to support this process, if used wisely and only after verifying the authenticity of information. These sorts of social [interactions](#) also [empower](#) people with invisible illness, and increase their hopefulness. Further, it [boosts a sense of belonging](#) and [self-esteem](#).

If you have an invisible illness then seek suggestions from supportive medical practitioners.

Invisible Illness As A Global Priority

Economic burden Vs. Funding

[Early detection](#) of invisible illnesses can delay and control the progression of these diseases. This further minimises direct medical costs by [avoiding high cost episodes](#), and creates better adherence to the treatment option. Conversely, misdiagnosis can [waste health care funds](#) unnecessarily. Besides, early treatment reduces [loss of working days](#) due to illness, and job productivity. These are [major indirect costs](#). According to a study in 2019, the annual indirect savings for a Multiple Sclerosis patient with proper treatment was [nearly \\$6377](#), in the USA.

Interestingly, there were [1.5 million CFS cases with \\$36-51 billion](#) in financial implications in the USA, before COVID. However in 2022, post-COVID, these figures have jumped dramatically to [five and nine million patients with \\$149 to \\$362 billion](#) in medical expenditure and income loss. This economic impact does not include [disability grants](#), social assistance, and earnings lost by caretakers. To offset the economic burden of invisible illness, funding needs to rise to about [40 times its current allocation](#).

Access to employment

People with mental health disorders are [keen to work](#). However, their unemployment rate is [double](#) the rate of those without any such disorders. Concurrently, income levels also show [drastic discrimination](#) for those with invisible illnesses. Much education is needed to enhance understanding, training, and empowerment for [actors in the employment sector](#) to integrate an inclusive labour force.

Employers should support [employees](#) with invisible illness to [return to work](#) at the earliest time after an ill period, through positive relationship management. [Communicating](#), providing information, and [rendering accommodations](#) can curb the inequities, harassment, and struggles that they face. The workplace must assist and treat these [talented workers](#) fairly. The economic benefits of doing so

will be [far-reaching](#). These types of actions and measure will help alleviate [unawareness and non-disclosure](#), which make the opportunity to measure and monitor findings concerning invisible illness difficult. Real data and information is invaluable for designing [appropriate government policies](#), and budgets for supporting people with invisible illness.

Many issues contribute to the stigmatisation of invisible illnesses.

Source: [Pexels.com](https://www.pexels.com)

why Is it essential that we focus on this issue?

Invisible illnesses are often [misunderstood and underdiagnosed](#), leading to lasting harm. In the USA, [96%](#) of people living with severe disability were living with an invisible illness Despite knowledge about these conditions including studies on the adversity they create in patients' lives, conditions such as [autoimmune diseases](#) are on the rise. Therefore, [speaking up](#) about these issues is critical. Building [a supportive circle](#) that can feel and understand the pain of patients can alleviate their physical and psychological distress. Information sharing, and advocating [necessary accommodations](#) can foster positive change.

We also must [draw more attention and funds](#) towards much needed [scientific research](#). Notably, [long COVID](#) has managed to [attract more medical research and financial resources](#) compared to other hidden conditions. Research is vital as these disorders present symptoms that [can mimic other conditions](#), and thus are hard to recognise. Furthermore, [evidence based approaches](#) will aid the medical community to [spot and medicate early](#). According to the Autoimmune Association, it takes [four physicians and 4.5 years](#) to diagnose a person with an autoimmune disease in the USA. Evidence based approaches will also [abolish the stigma](#) against sufferers of invisible illness.

Impact on achieving the Sustainability Development Goals (SDGs)

Funding and medical research to understand invisible illnesses can shed light on [early diagnosis and disease progression](#). The medical community needs to change its approach and attitude towards patients with invisible illness ([Scoles & Nicodemo, 2022](#)). Medical intervention can control/delay the crippling effect of illness on [one's functionality as well as financial independence](#). This will promote the [SDGs](#) that relate to [poverty](#), [hunger](#), good health and employment.

The goals of destigmatising invisible illness and promoting [an inclusive society](#) and labour force warrants education and training to spread awareness. Removing systemic [barriers](#) including [gender bias](#) and other [inequalities](#) is key to eliminating discrimination. [Accommodating persons with invisible illnesses through innovation](#) and [smart technologies](#) will [improve disclosure that can aid in policy formulations](#) and fund allocations ([Abualghaib, Groce, Simeu, Carew, & Mont, 2019](#)). [The potential economic contributions](#) of people living with invisible illness through [their participation](#) in the [workforce are immense](#). Since the number of people with invisible illnesses is [rising](#) and [they can offer diverse](#) skill sets and [perspectives](#). This will help to attain the [SDGs](#) that relate to decent work, [economic growth](#), [gender equality](#), [reduced inequalities](#), [justice](#), [innovation](#), etc ([Abualghaib, Groce, Simeu, Carew, & Mont, 2019](#)).
